

HOW RTG MANAGES SINGLE TRADER OR TRADING GROUPS

RTG Risk Manager offers traders and risk managers access to all trading activities from any location in real-time. This software is used for monitoring the preset daily risk limits and daily targets. Once the trader achieves the preset daily limit or daily target, she or he will be locked out from further trading. New positions can then no longer be executed. At this point, all open positions and order entries will automatically be closed.

RTG Risk Manager can be either used independently by traders themselves to manage their own risks or remotely controlled by a risk manager. RTG Auto Risk Manager gives risk managers a sophisticated solution for monitoring the risks of all traders with the RTG Auto Risk Client on their PCs from everywhere they can go online
